1. Operator account setup

Operators create venue records, invite portal users, and assign permissions for inventory, pricing, bookings, and finance views.

Operator comments can look similar to customer complaints while describing a different side of the same event. An operator saying 'customers can still request a room after I block it' and a customer saying 'the room was unavailable when I arrived' may be connected, but the analysis should retain both sources.

Portal review

- Check the venue and workspace identifier.
- Check the date/time of the inventory change.
- Check whether the action was single-item or bulk.
- Check whether the customer booking was created before or after the change.

Research note

Operator feedback is especially useful for identifying operational workarounds. A repeated workaround can indicate product friction even when operators eventually achieve the desired result.

Example

Feedback about operator account setup should keep the operator segment visible so it is not counted as if it came from an end customer.

Example from day-to-day use

A normal DeskNest case involving operator account setup usually contains more context than one short label. The customer may mention the booking date, whether they were booking for themselves or a team, whether support was contacted, and what happened next. Keeping that context makes later analysis more useful than reducing the record to a single category.

The same visible symptom can come from different underlying situations. When possible, preserve the part of the journey, customer segment, channel, and original wording so a reviewer can distinguish similar-looking complaints.

What to keep with the record

- Stable feedback or source ID.
- Customer segment when known.
- Date and channel.
- Original wording.
- Relevant booking, venue, or account context when available.

Operator workflow

Operators work across venue calendars, local bookings, private events, pricing, staff changes, and customer arrivals. A portal action that takes only a few extra clicks for one workspace can become a major issue when repeated across several rooms and dates.

Operator feedback can therefore be especially sensitive to volume and repetition. A workaround may be acceptable for a small venue and painful for a multi-site operator.

2. Venue listing

Operators maintain location, photos, access instructions, opening hours, amenities, and house rules.

Operator comments can look similar to customer complaints while describing a different side of the same event. An operator saying 'customers can still request a room after I block it' and a customer saying 'the room was unavailable when I arrived' may be connected, but the analysis should retain both sources.

- Check the venue and workspace identifier.
- Check the date/time of the inventory change.

Operator feedback can therefore be especially sensitive to volume and repetition. A workaround may be acceptable for a small venue and painful for a multi-site operator.

3. Inventory model

Inventory is organized by workspace type and bookable unit. A meeting room may be one unit while a hot-desk area can contain several desks.

Operator comments can look similar to customer complaints while describing a different side of the same event. An operator saying 'customers can still request a room after I block it' and a customer saying 'the room was unavailable when I arrived' may be connected, but the analysis should retain both sources.

Example

Feedback about inventory model should keep the operator segment visible so it is not counted as if it came from an end customer.

Example from day-to-day use

A normal DeskNest case involving inventory model usually contains more context than one short label. The customer may mention the booking date, whether they were booking for themselves or a team, whether support was contacted, and what happened next. Keeping that context makes later analysis more useful than reducing the record to a single category.

The same visible symptom can come from different underlying situations. When possible, preserve the part of the journey, customer segment, channel, and original wording so a reviewer can distinguish similar-looking complaints.

Operator feedback can therefore be especially sensitive to volume and repetition. A workaround may be acceptable for a small venue and painful for a multi-site operator.

4. Calendar management

Operators can block inventory for maintenance, private events, or local bookings that are not created through DeskNest.

Operator comments can look similar to customer complaints while describing a different side of the same event. An operator saying 'customers can still request a room after I block it' and a customer saying 'the room was unavailable when I arrived' may be connected, but the analysis should retain both sources.

Operator feedback can therefore be especially sensitive to volume and repetition. A workaround may be acceptable for a small venue and painful for a multi-site operator.

5. Bulk changes

Bulk actions are available for selected inventory updates, but some fields still require workspace-level edits.

Operator comments can look similar to customer complaints while describing a different side of the same event. An operator saying 'customers can still request a room after I block it' and a customer saying 'the room was unavailable when I arrived' may be connected, but the analysis should retain both sources.

Operator feedback can therefore be especially sensitive to volume and repetition. A workaround may be acceptable for a small venue and painful for a multi-site operator.

6. Pricing

Operators manage base prices and selected date-based adjustments. Customer totals can also include DeskNest fees and taxes.

Operator comments can look similar to customer complaints while describing a different side of the same event. An operator saying 'customers can still request a room after I block it' and a customer saying 'the room was unavailable when I arrived' may be connected, but the analysis should retain both sources.

Portal review

- Check the venue and workspace identifier.
- Check the date/time of the inventory change.

Operator feedback can therefore be especially sensitive to volume and repetition. A workaround may be acceptable for a small venue and painful for a multi-site operator.

7. Booking changes

Operators can review upcoming bookings and contact support when a change cannot be completed through the portal.

Operator comments can look similar to customer complaints while describing a different side of the same event. An operator saying 'customers can still request a room after I block it' and a customer saying 'the room was unavailable when I arrived' may be connected, but the analysis should retain both sources.

Portal review

- Check the venue and workspace identifier.
- Check the date/time of the inventory change.

Operator feedback can therefore be especially sensitive to volume and repetition. A workaround may be acceptable for a small venue and painful for a multi-site operator.

8. Check-in information

Venue access notes, reception instructions, and after-hours details should remain current so confirmed customers can enter the space.

Operator comments can look similar to customer complaints while describing a different side of the same event. An operator saying 'customers can still request a room after I block it' and a customer saying 'the room was unavailable when I arrived' may be connected, but the analysis should retain both sources.

Portal review

- Check the venue and workspace identifier.
- Check the date/time of the inventory change.

The customer may mention the booking date, whether they were booking for themselves or a team, whether support was contacted, and what happened next. Operator feedback can therefore be especially sensitive to volume and repetition. A workaround may be acceptable for a small venue and painful for a multi-site operator.

9. Availability disputes

If a confirmed customer arrives and the space is unavailable, operations should compare portal inventory, local venue records, and recent manual blocks.

Operator comments can look similar to customer complaints while describing a different side of the same event. An operator saying 'customers can still request a room after I block it' and a customer saying 'the room was unavailable when I arrived' may be connected, but the analysis should retain both sources.

Portal review

- Check the venue and workspace identifier.
- Check the date/time of the inventory change.

Operator feedback can therefore be especially sensitive to volume and repetition. A workaround may be acceptable for a small venue and painful for a multi-site operator.

10. Listing accuracy

Amenity details should reflect the actual workspace. An amenity available somewhere in the building should not be presented as guaranteed at every desk.

Operator comments can look similar to customer complaints while describing a different side of the same event. An operator saying 'customers can still request a room after I block it' and a customer saying 'the room was unavailable when I arrived' may be connected, but the analysis should retain both sources.

Portal review

- Check the venue and workspace identifier.
- Check the date/time of the inventory change.

Operator feedback can therefore be especially sensitive to volume and repetition. A workaround may be acceptable for a small venue and painful for a multi-site operator.

11. Payout and reconciliation

Operators review booking and payout information separately from customer receipts. Reconciliation issues should preserve the booking IDs involved.

Operator comments can look similar to customer complaints while describing a different side of the same event. An operator saying 'customers can still request a room after I block it' and a customer saying 'the room was unavailable when I arrived' may be connected, but the analysis should retain both sources.

Portal review

12. Operator support

Operator support cases often involve inventory sync, bulk changes, pricing, customer booking changes, and payout questions.

Operator comments can look similar to customer complaints while describing a different side of the same event. An operator saying 'customers can still request a room after I block it' and a customer saying 'the room was unavailable when I arrived' may be connected, but the analysis should retain both sources.
